SDIO, UART, AND AUDIO VOLTAGE-TRANSLATION TRANSCEIVER

Check for Samples: TWL1200

FEATURES

- **Level Translator**
  - **V_{CCA} and V_{CCB} Range of 1.1 V to 3.6 V**
- **Seamlessly Bridges 1.8-V/2.6-V Digital-Switching Compatibility Gap Between 2.6-V processors and TI's Wi-Link (WL1271 and WL1273)**
- **Latch-Up Performance Exceeds 100 mA Per JESD 78, Class II**
- **ESD Protection Exceeds JESD 22**
  - **2500-V Human-Body Model (A114-B)**
  - **250-V Machine Model (A115-A)**
  - **1500-V Charged-Device Model (C101)**

DESCRIPTION/ORDERING INFORMATION

The TWL1200 is an 19-bit voltage translator specifically designed to seamlessly bridge the 1.8-V/2.6-V digital-switching compatibility gap between 2.6-V baseband and the TI Wi-Link-6 (WL1271/3). It is optimized for SDIO, UART, and audio functions. The TWL1200 has two supply-voltage pins, V_{CCA} and V_{CCB}, that can be operated over the full range of 1.1 V to 3.6 V. The TWL1200 enables system designers to easily interface applications processors or digital basebands to peripherals operating at a different I/O voltage levels, such as the TI Wi-Link-6 (WL1271/3) or other SDIO/memory cards.

The TWL1200 is offered in both 48-ball 0.5-mm ball grid array (BGA) and 49-bump 0.4-mm wafer chip scale package (WCSP) packages. Low static power consumption and small package size make the TWL1200 an ideal choice for mobile-phone applications.

ORDERING INFORMATION(1)

T_A	PACKAGE(2)		ORDERABLE PART NUMBER	TOP-SIDE MARKING
–40°C to 85°C	BGA MicroStar Junior™ – ZQC (Pb-free)	Tape and reel	TWL1200ZQCR	YW200
	WCSP ™ – YFF (Pb-free)	Tape and reel	TWL1200YFFR	YW200

(1) For the most current package and ordering information, see the Package Option Addendum at the end of this document, or see the TI web site at www.ti.com.
(2) Package drawings, thermal data, and symbolization are available at www.ti.com/packaging.

TERMINAL FUNCTIONS

TERMINAL			TYPE	DESCRIPTION
ZQC BALL NO.	YFF BUMP NO.	NAME		
C4, D4	C4, D4	V_{CCA}	Power	A-side supply voltage (1.1 V to 3.6 V)
B2	B2	SDIO_DATA0(A)	I/O	Data bit 1 connected to baseband SDIO controller
C2	C2	SDIO_DATA1(A)	I/O	Data bit 2 connected to baseband SDIO controller
C1	C1	SDIO_DATA2(A)	I/O	Data bit 3 connected to baseband SDIO controller
B1	B1	SDIO_DATA3(A)	I/O	Data bit 4 connected to baseband SDIO controller
A2	A2	SDIO_CMD(A)	I/O	Command bit connected to baseband SDIO controller. Referenced to V_{CCA}.
A6	A6	SDIO_CMD(B)	I/O	Command bit connected to SD/SDIO peripheral. Includes a 15-kΩ pullup resistor to V_{CCB}.
D3, E3, E4, E5	D3, E3, E4, E5	GND		Ground
B6	B6	SDIO_DATA0(B)	I/O	Data bit 1 connected to SD/SDIO peripheral
C6	C6	SDIO_DATA1(B)	I/O	Data bit 2 connected to SD/SDIO peripheral
C7	C7	SDIO_DATA2(B)	I/O	Data bit 3 connected to SD/SDIO peripheral
B7	B7	SDIO_DATA3(B)	I/O	Data bit 4 connected to SD/SDIO peripheral
A1	A1	SDIO_CLK(A)	I	Clock signal connected to baseband SDIO controller. Referenced to V_{CCA}.
A7	A7	SDIO_CLK(B)	O	Clock signal connected to SD/SDIO peripheral. Referenced to V_{CCB}; drive strength = 8 mA
C5, D5	C5, D5	V_{CCB}	Pwr	B-side supply voltage (1.1 V to 3.6 V)
C3	C3	–	–	No ball (for ZQC) and No-Connect (for YFF)
B4	B4	$\overline{OE}$	I	Output enable (active low)
A4	A4	AUD_DIR	I	Direction control signal for AUDIO_CLK and AUDIO_F-SYNC signals
G3	G3	AUDIO_OUT(A)	O	Connected to baseband audio subsystem; drive strength = 4 mA
G5	G5	AUDIO_OUT(B)	I	Connected to Wi-Link-6 PCM subsystem
D1	D1	WLAN_EN(A)	I	Connected to baseband SDIO controller
D6	D6	WLAN_EN(B)	O	Connected to SD/SDIO peripheral; drive strength = 2 mA
G2	G2	BT_UART_TX(A)	O	Connected to baseband UART subsystem; drive strength = 8 mA
G6	G6	BT_UART_TX(B)	I	Connected to BT UART subsystem of Wi-Link-6
D2	D2	WLAN_IRQ(A)	O	Connected to baseband SDIO controller; drive strength = 4 mA

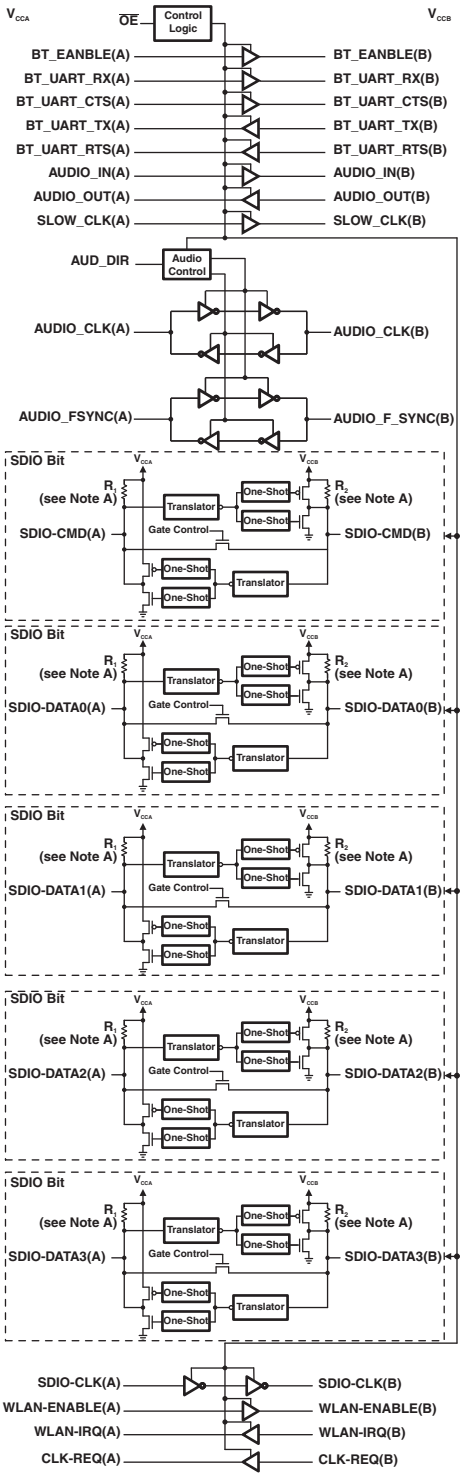
TERMINAL FUNCTIONS (continued)

TERMINAL			TYPE	DESCRIPTION
ZQC BALL NO.	YFF BUMP NO.	NAME		
D7	D7	WLAN_IRQ(B)	I	Connected to SD/SDIO peripheral
G4	G4	SLOW_CLK(A)	I	Low frequency 32-kHz clock connected to baseband device
F4	F4	SLOW_CLK(B)	O	Low frequency 32-kHz clock connected to Wi-Link-6 device; drive strength = 2 mA
G1	G1	BT_UART_RX(A)	I	Connected to baseband UART subsystem
G7	G7	BT_UART_RX(B)	O	Connected to BT UART subsystem of Wi-Link-6; drive strength = 8 mA
E1	E1	CLK_REQ(A)	O	Connected to baseband SDIO controller; drive strength = 4 mA
E7	E7	CLK_REQ(B)	I	Connected to SD/SDIO peripheral
F1	F1	BT_UART_CTS(A)	I	Connected to baseband UART subsystem
F3	F3	AUDIO_IN(A)	I	Connected to baseband audio subsystem
F5	F5	AUDIO_IN(B)	O	Connected to Wi-Link-6 PCM subsystem; drive strength = 4 mA
A3	A3	AUDIO_CLK(A)	I/O	Connected to baseband audio subsystem; drive strength = 4 mA
A5	A5	AUDIO_CLK(B)	I/O	Connected to Wi-Link-6 PCM subsystem; drive strength = 4 mA
E2	E2	BT_EN(A)	I	Connected to baseband UART subsystem
E6	E6	BT_EN(B)	O	Connected to BT UART subsystem of Wi-Link-6; drive strength = 2 mA
F7	F7	BT_UART CTS(B)	O	Connected to BT UART subsystem of Wi-Link-6; drive strength = 4 mA
F2	F2	BT_UART RTS(A)	O	Connected to baseband UART subsystem; drive strength = 4 mA
F6	F6	BT_UART RTS(B)	I	Connected to BT UART subsystem of Wi-Link-6
B3	B3	AUDIO_F-SYN(A)	I/O	Connected to baseband audio subsystem; drive strength = 4 mA
B5	B5	AUDIO_F-SYN(B)	I/O	Connected to Wi-Link-6 PCM subsystem; drive strength = 4 mA

Table 1. FUNCTION TABLE

CONTROL INPUTS		OPERATION
$\overline{OE}$	AUD_DIR	
H	X	All outputs are Hi-Z
L	H	AUDIO_CLK(A) to AUDIO_CLK(B) and AUDIO_F-SYNC(A) to AUDIO_F-SYNC(B)
L	L	AUDIO_CLK(B) to AUDIO_CLK(A) and AUDIO_F-SYNC(B) to AUDIO_F-SYNC(A)

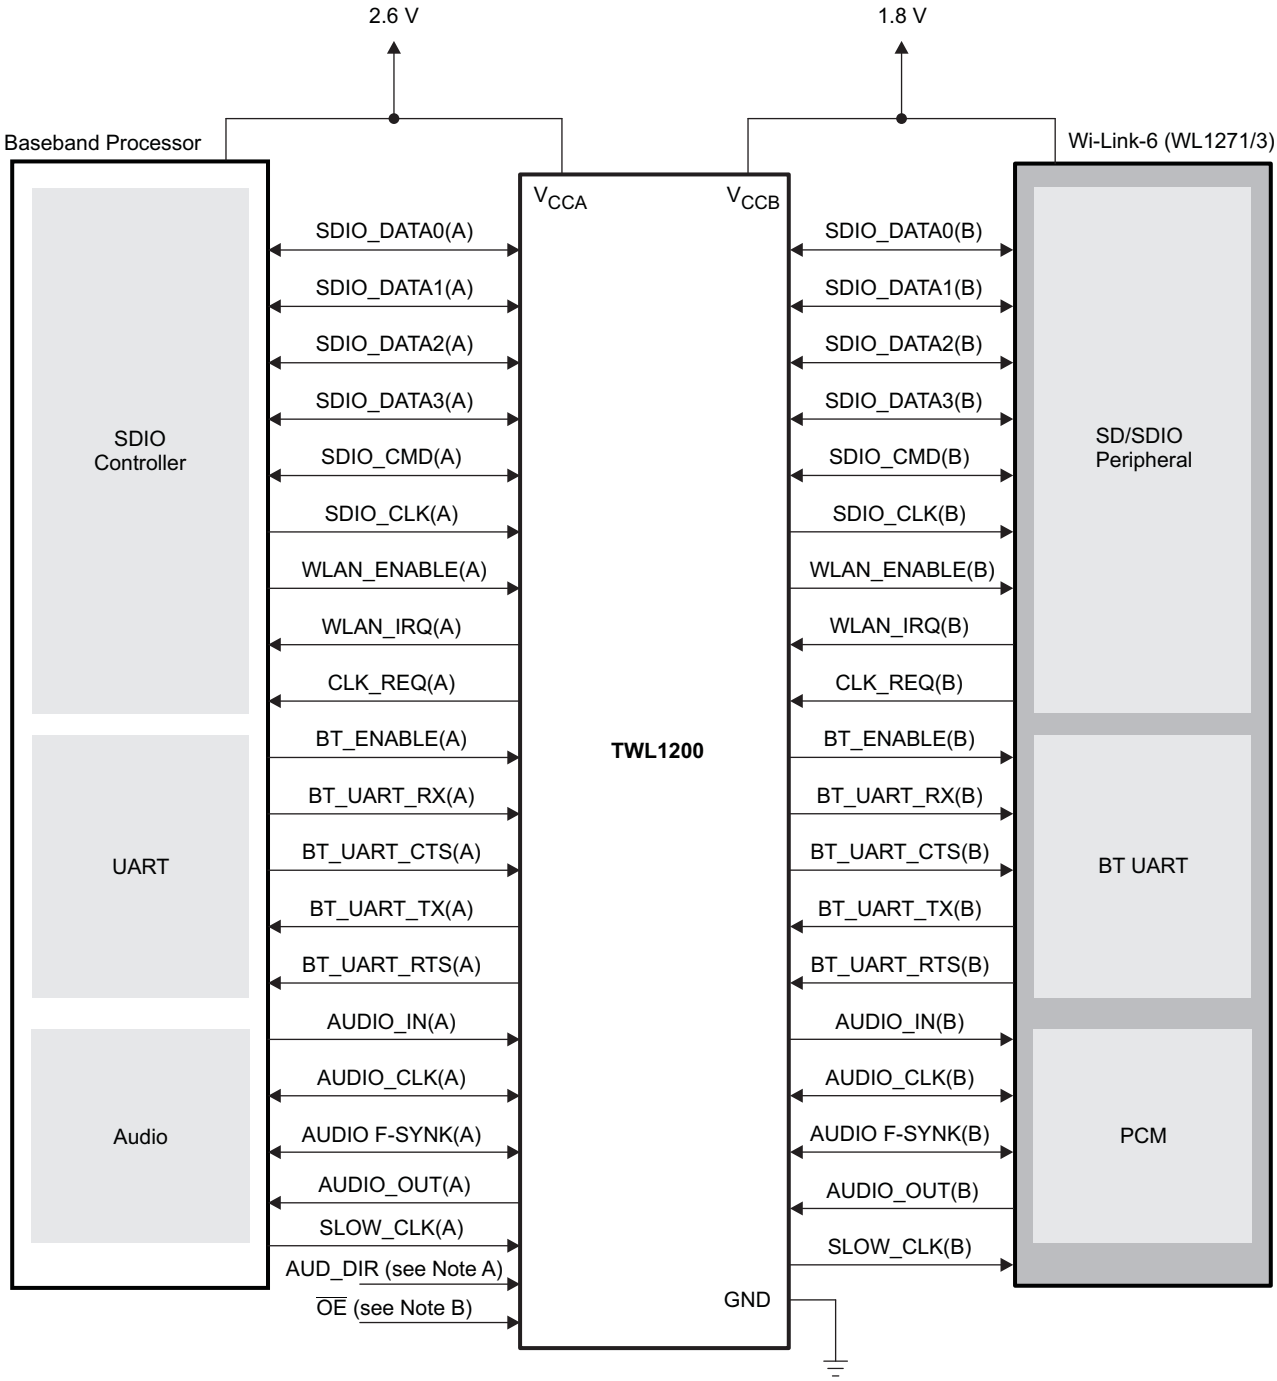
LOGIC DIAGRAM



A. R_1 and R_2 resistor values are determined based upon the logic level applied to the A port or B port as follows:
R_1 and R_2 = 25 kΩ when a logic level low is applied to the A port or B port.
R_1 and R_2 = 4 kΩ when a logic level high is applied to the A port or B port.
R_1 and R_2 = 70 kΩ when the port is deselected (or in High-Z or 3-state).

B. $\overline{OE}$ controls all output buffers. When $\overline{OE}$ = high, all outputs are Hi-Z.

TYPICAL APPLICATION BLOCK DIAGRAM



A. AUD_DIR must be biased to determine audio direction (see Function Table for properly establishing the bias).

B. $\overline{OE}$ is an active-low pin that must be grounded to 0 V to enable operation of the TWL1200 device.

ABSOLUTE MAXIMUM RATINGS(1)

over operating free-air temperature range (unless otherwise noted)

			MIN	MAX	UNIT
V_{CCA}	Supply voltage range		–0.5	4.6	V
V_{CCB}	Supply voltage range		–0.5	4.6	V
V_I	Input voltage range	I/O ports (A port)	–0.5	4.6	V
		I/O ports (B port)	–0.5	4.6	
		Control inputs	–0.5	4.6	
V_O	Voltage range applied to any output in the high-impedance or power-off state(2)	A port	–0.5	4.6	V
		B port	–0.5	4.6	
V_O	Voltage range applied to any output in the high or low state(2)	A port	–0.5	4.6	V
		B port	–0.5	4.6	
I_{IK}	Input clamp current	$V_I < 0$		–50	mA
I_{OK}	Output clamp current	$V_O < 0$		–50	mA
I_O	Continuous output current			±50	mA
	Continuous current through V_{CCA}, V_{CCB}, or GND			±100	mA
T_{stg}	Storage temperature range		–65	150	°C

(1) Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) The input and output voltage ratings may be exceeded if the input and output clamp-current ratings are observed.

THERMAL IMPEDANCE RATINGS

				UNIT
θ_{JA}	Package thermal impedance(1)	ZQC package	171.6	°C/W
		YFF package	75	

(1) The package thermal impedance is calculated in accordance with JESD 51-7.

RECOMMENDED OPERATING CONDITIONS(1)

			V_{CCI}	V_{CCO}	MIN	MAX	UNIT
V_{CCA}	Supply voltage				1.1	3.6	V
V_{CCB}	Supply voltage				1.1	3.6	V
V_{IH}	High-level input voltage	Buffer type	1.1 V to 3.6 V	1.1 V to 3.6 V	V_{CCI} × 0.65	3.6	V
		$\overline{OE}$ and AUD_DIR			V_{CCA} × 0.65	3.6	
V_{IH}	High-level input voltage	Switch type	1.1 V to 3.6 V	1.1 V to 3.6 V	V_{CCI} – 0.2	V_{CCI}	V
V_{IL}	Low-level input voltage	Buffer type and Control Logic	1.1 V to 3.6 V	1.1 V to 3.6 V	0	V_{CCI} × 0.35	V
		$\overline{OE}$ and AUD_DIR			0	V_{CCA} × 0.35	
V_{IL} (2)	Low-level input voltage	Switch type	1.1 V to 3.6 V	1.1 V to 3.6 V	0	0.15	V
V_I	Input voltage				0	3.6	V
V_O	Output voltage	Active state			0	V_{CCO}	V
		3-state			0	3.6	
I_{OH}	High-level output current			1.1 V to 1.3 V		–0.5	mA
				1.4 V to 1.6 V		–1	
				1.65 V to 1.95 V		–2	
				2.3 V to 2.7 V		–4	
				3 V to 3.6 V		–8	
I_{OL}	Low-level output current			1.1 V to 1.3 V		0.5	mA
				1.4 V to 1.6 V		1	
				1.65 V to 1.95 V		2	
				2.3 V to 2.7 V		4	
				3 V to 3.6 V		8	
Δt/Δv	Input transition rise or fall rate					5	ns/V
T_A	Operating free-air temperature				–40	85	°C

(1) All unused data inputs of the device must be held at V_{CCI} or GND to ensure proper device operation. Refer to the TI application report, *Implications of Slow or Floating CMOS Inputs*, literature number SCBA004.
(2) Note, the max V_{IL} value is provided to ensure that a valid V_{OL} is maintained. The V_{OL} value is the V_{IL} + the voltage-drop across the pass-gate transistor.

ELECTRICAL CHARACTERISTICS

over recommended operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	V_{CCA}	V_{CCB}	MIN	TYP(1)	MAX	UNIT

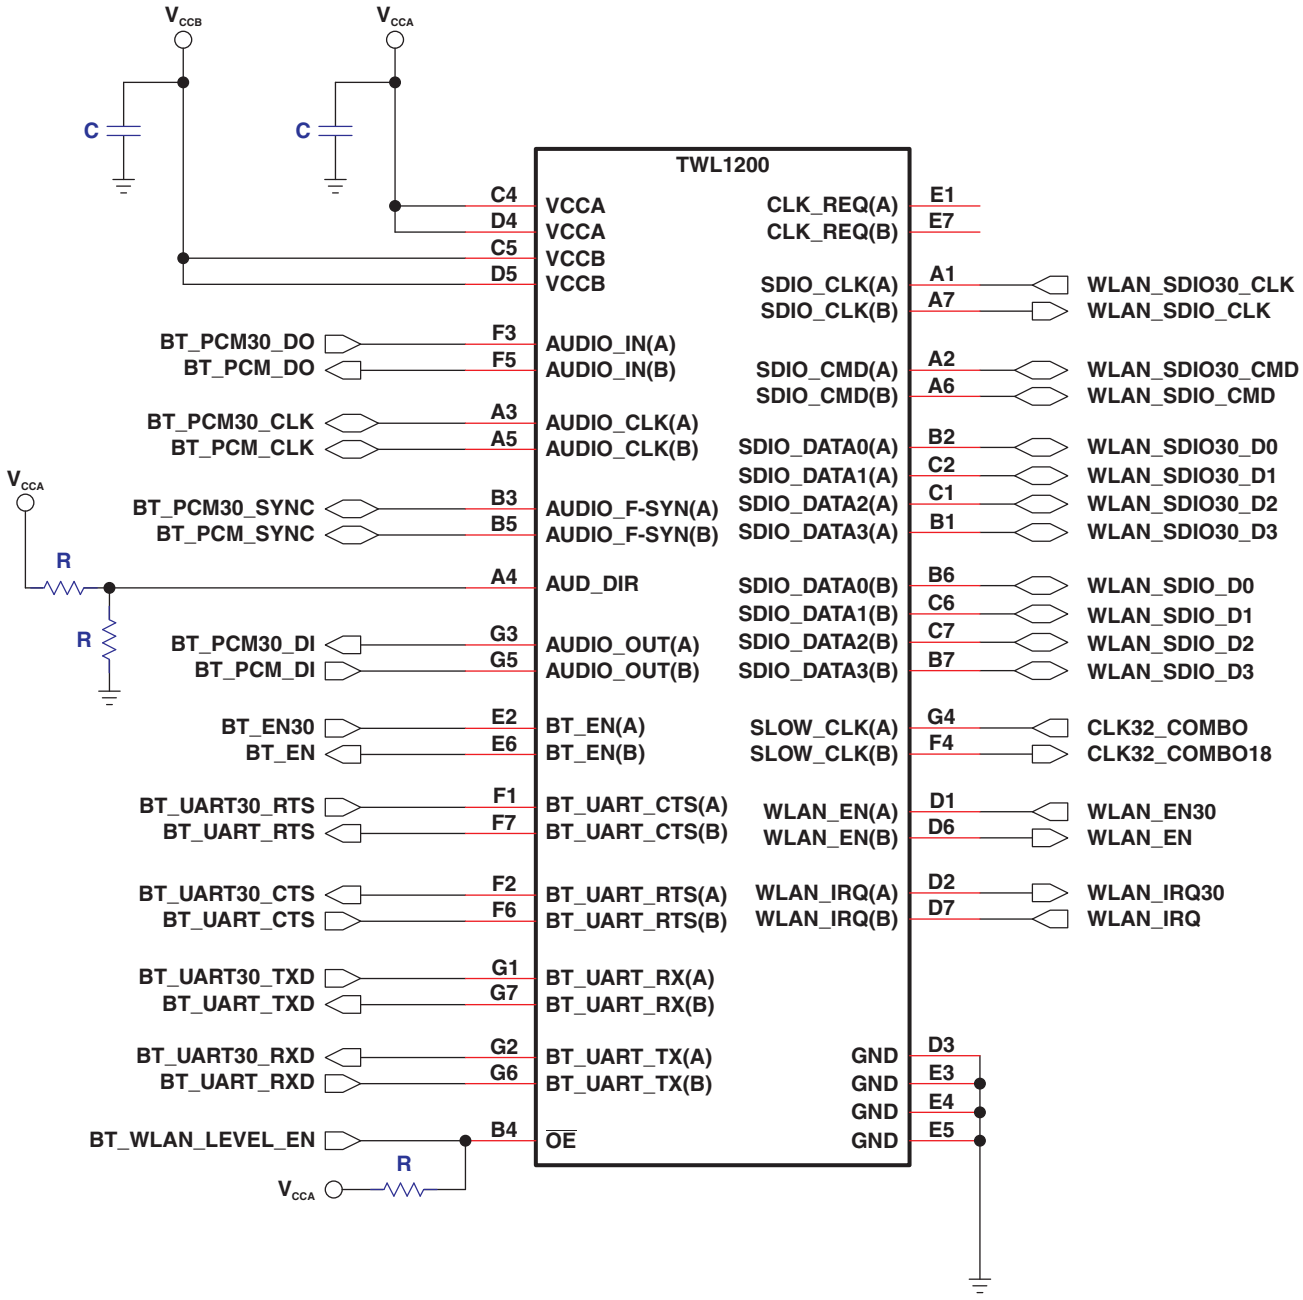

Figure 26. Application Circuit Example, With Voltage Divider for AUD_DIR Connection

PRINCIPLES OF OPERATION

Applications

The TWL1200 device has been designed to bridge the digital-switching compatibility gap between two voltage nodes to successfully interface logic threshold levels between a host processor and the Texas Instruments Wi-Link-6 WLAN/BT/FM products. It is intended to be used in a point-to-point topology when interfacing these devices that may or may not be operating at different interface voltages.

Architecture

The BT/UART and PCM/Audio subsystem interfaces consist of a fully-buffered voltage translator design that has its output transistors to source and sink current optimized for drive strength.

The SDIO lines comprise a semi-buffered auto-direction-sensing based translator architecture (see Figure 27) that does not require a direction-control signal to control the direction of data flow of the A to B ports (or from B to A ports).

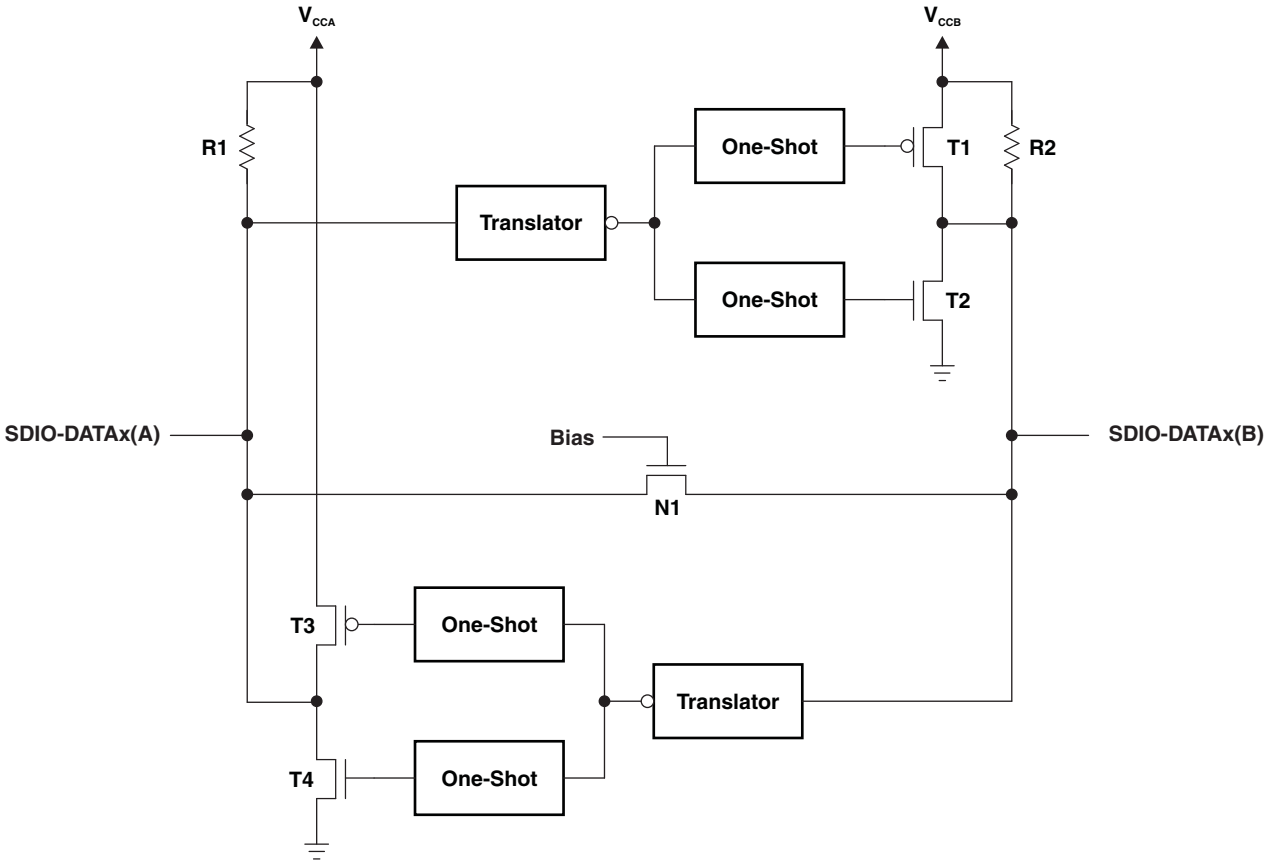

Figure 27. Architecture of an SDIO Switch-Type Cell

Each of these bidirectional SDIO channels independently determines the direction of data flow without a direction-control signal. Each I/O pin can be automatically reconfigured as either an input or an output, which is how this auto-direction feature is realized.

The following two key circuits are employed to facilitate the "switch-type" voltage translation function:

1. Integrated pullup resistors to provide dc-bias and drive capabilities
2. An N-channel pass-gate transistor topology (with a high R_{ON} of ~300 Ω) that ties the A-port to the B-port
3. Output one-shot (O.S.) edge-rate accelerator circuitry to detect and accelerate rising edges on the A or B ports

For bidirectional voltage translation, pullup resistors are included on the device for dc current sourcing capability. The V_{GATE} gate bias of the N-channel pass transistor is set at a level that optimizes the switch characteristics for maximum data rate as well as minimal static supply leakage. Data can flow in either direction without guidance from a control signal.

The edge-rate acceleration circuitry speeds up the output slew rate by monitoring the input edge for transitions, helping maintain the data rate through the device.

During a low-to-high signal rising-edge, the O.S. circuits turn on the PMOS transistors (T_1, T_3) and its associated driver output resistance of the driver is decreased to approximately 50 Ω to 70 Ω during this acceleration phase to increase the current drive capability of the driver for approximately 30 ns or 95% of the input edge, whichever occurs first. This edge-rate acceleration provides high ac drive by bypassing the internal pullup resistors during the low-to-high transition to speed up the rising-edge signal.

During a high-to-low signal falling-edge, the O.S. circuits turn on the NMOS transistors (T_2, T_4) and its associated driver output resistance of the driver is decreased to approximately 50 Ω to 70 Ω during this acceleration phase to increase the current drive capability of the driver for approximately 30 ns or 95% of the input edge, whichever occurs first.

To minimize dynamic I_{CC} and the possibility of signal contention, the user should wait for the O.S. circuit to turn-off before applying a signal in the opposite direction. The worst-case duration is equal to the minimum pulse-width number provided in the *Timing Requirements* section of this data sheet.

Once the O.S. is triggered and switched off, both the A and B ports must go to the same state (i.e. both High or both Low) for the one-shot to trigger again. In a DC state, the output drivers maintain a Low state through the pass transistor. The output drivers maintain a High through the "smart pullup resistors" that dynamically change value based on whether a Low or a High is being passed through the SDIO lines, as follows:

- R_{PU1} and R_{PU2} values are 25 kΩ when the output is driving a low
- R_{PU1} and R_{PU2} values are 4 kΩ when the output is driving a high
- R_{PU1} and R_{PU2} values are 70 kΩ when the device is disabled via the $\overline{OE}$ pin or by pulling the either V_{CCA} or V_{CCB} to 0 V.

The reason for using these "smart" pullup resistors is to allow the TWL1200 to realize a lower static power consumption (when the I/Os are low), support lower V_{OL} values for the same size pass-gate transistor, and improved simultaneous switching performance.

Input Driver Requirements

The continuous dc-current "sinking" capability is determined by the external system-level driver interfaced to the SDIO pins. Since the high bandwidth of these bidirectional SDIO circuits necessitates the need for a port to quickly change from an input to an output (and vice-vera), they have a modest dc-current "sourcing" capability of hundreds of micro-Amps, as determined by the smart pullup resistor values.

The fall time (t_{fA}, t_{fB}) of a signal depends on the edge rate and output impedance of the external device driving the SDIO I/Os, as well as the capacitive loading on these lines.

Similarly, the t_{pd} and max data rates also depend on the output impedance of the external driver. The values for t_{fA}, t_{fB}, t_{pd}, and maximum data rates in the data sheet assume that the output impedance of the external driver is less than 50 Ω.

Output Load Considerations

TI recommends careful PCB layout practices with short PCB trace lengths to avoid excessive capacitive loading and to ensure that proper O.S. triggering takes place. PCB signal trace-lengths should be kept short enough such that the round trip delay of any reflection is less than the one-shot duration. This improves signal integrity by ensuring that any reflection sees a low impedance at the driver. The O.S. circuits have been designed to stay on for approximately 30 ns. The maximum capacitance of the lumped load that can be driven also depends directly on the one-shot duration. With very heavy capacitive loads, the one-shot can time-out before the signal is driven fully to the positive rail. The O.S. duration has been set to best optimize trade-offs between dynamic I_{CC}, load driving capability, and maximum bit-rate considerations. Both PCB trace length and connectors add to the capacitance that the TWL1200 SDIO output sees, so it is recommended that this lumped-load capacitance be considered and kept below 75 pF to avoid O.S. retriggering, bus contention, output signal oscillations, or other adverse system-level affects.

Package Dimensions

The dimensions for the YFF package are shown in Table 3. See the package drawing at the end of this data sheet.

Table 3. YFF Package Dimensions

Packaged Device	D	E
TWL1200YFFR	2.76 ± 0.03 mm	2.76 ± 0.03 mm

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TWL1200YFFR	ACTIVE	DSBGA	YFF	49	3000	RoHS & Green	SNAGCU	Level-1-260C-UNLIM	-40 to 85	YW200	Samples

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
